Stainless steel reinforcement

How to use stainless steel reinforcement?

The main standards for specifying stainless steel rebar are BS6744 and ASTM A955/955M. Other National Standards and Official Admissions are available in Denmark, Italy, France and Finland, but are less used.

Stainless steel rebar permits:

- A reduction of the concrete cover
- The elimination of concrete sealants such as Silane
- A sustained concrete protection in all areas, including those that cannot be seen and monitored.
